

"Cryptochrome is a ubiquitous pigment in animals and plants. Plants use it to sense light to optimize their ability to photosynthesize. Animals use it to sense the direction of the Earth's magnetic field. Both animals and plants also use it to regulate their body clocks, which anticipate dawn and dusk to switch metabolism between day and night modes. In animals, it regulates the sleep-wake cycle and also the immune system, which has peak activity during the night phase (Koukkari and Sothern 2006)."

Unfortunately, radio waves badly upset the cryptochrome molecule to affect all of these functions."

Andrew Goldsworthy Testimony April 2010
